Abstracts

The global Ex Vivo Human Skin Models market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Compared with in vitro skin models, ex vivo models can be more accurate on representing the human skin in some case, such as the effect of the extracellular matrix (ECM) in terms of structure, cell signaling mechanisms and the processes of metabolism, the incorporation of skin appendages such as hair follicles and sweat glands, and the effects of dermal absorption. Ex vivo human skin is more appropriate for certain types of research, use of whole skin biopsies in culture allows the effect of individual ingredients and formulations, transdermal delivery, topical penetration and percutaneous absorption to be tested in an environment more closely mimicking normal skin.
