The global Excavator Roller market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The supporting wheel is one of the four wheel belts of the crawler construction machinery chassis. Excavator rollers are made of a suitable boron steel alloy and consist of a roller body, shaft, collar, bimetal bearing and seal pack. And through concentrated or induction hardening treatment. Its main function is to support the weight of excavators and bulldozers, so that the tracks move along the wheels. The rollers are used to support the weight of the excavator when rolling on the surface of the guide rail (connecting rod) or the track shoe of the track, and are also used to limit the track to prevent lateral slippage. When the tractor turns, the rollers force the tracks to slide on the ground.
