Abstracts

When the main engines run it gives out exhaust gas which is used by the exhaust gas turbocharger. Even after the usage of the exhaust gas there is a good amount of heat energy remaining in it. The exhaust gas has a temperature around 200°C. Which is utilized by the economizer. The water is taken from the water drum with help of a centrifugal pump, which is passed the tubes present in the exhaust gas economizer. The exhaust gas containing around 200 °C is passed through outside of the tube where the water is heated. Later it is passed to a steam drum and further used for different purposes.
