According to our (Global Info Research) latest study, the global Exhaust Gas Recirculation Tube market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The exhaust gas recirculation tube is an emissions component that is found on many road going cars and trucks. It is a part of the vehicle's exhaust gas recirculation (EGR) system, which is designed to recirculate exhaust gases back into the engine in order to reduce cylinder temperatures and emissions. The EGR tube is the passage through which the vehicle's exhaust gases travel from the exhaust back into the intake. When the EGR solenoid or valve is opened, exhaust gas is allowed through the tube, and into the engine for consumption. When the EGR tube fails or has any issues, it can cause problems with the operation of the EGR system, which can increase emissions levels and even negatively affect engine performance. Usually a bad or failing EGR tube will produce a few symptoms that can alert the driver of a potential issue that should be serviced.
