Exhaust manifolds and risers are essential components in marine engines, responsible for directing and cooling exhaust gases to protect the engine. The exhaust manifold gathers exhaust gases from each cylinder and channels them into a single stream. In marine engines, it is typically water-cooled to prevent overheating. The exhaust riser, attached after the manifold, raises the exhaust path, preventing water backflow into the engine—a crucial feature for marine applications to avoid engine damage. Together, these parts ensure efficient exhaust expulsion, reduce engine temperature, and protect against corrosion. Regular maintenance is required as exposure to saltwater and exhaust gases can lead to corrosion over time.
