An exoskeleton sports knee brace, also known as a robotic knee brace or powered knee orthosis, is a wearable device designed to assist individuals with damaged or disabled knee joints. It is a mechanical brace that fits around the knee joint and is equipped with motors and sensors that work together to support and assist during walking or other activities. The robotic knee brace uses sensors to detect the user's movement and activates motors, providing additional support or resistance as needed. This can help reduce stress on the knee joint and improve overall mobility and function. Some robotic knee braces also include smart features, such as real-time feedback and gait analysis, to help users track progress and adjust their movement patterns as needed. Robotic knee braces can be used in a variety of conditions, including knee osteoarthritis, stroke, spinal cord injuries, and other neuromuscular disorders.
