Abstracts

The global Exosome Extraction Isolation and Isolation Purification Kit market size is expected to reach $ 763 million by 2032, rising at a market growth of 18.6% CAGR during the forecast period (2026-2032).

Exosomes are extracellular vesicles (EVs) with a diameter of approximately 30-150 nm secreted by living cells. Contains active molecules such as nucleic acids, proteins and lipids derived from cells, which have functions such as mediating intercellular communication and play important roles in mammalian reproduction and development, immune response and infection, as well as metabolic diseases, cardiovascular health, neurodegenerative diseases and It plays an important role in various diseases, including cancer, and is also an ideal liquid biopsy marker and therapeutic carrier. In 2025, global Exosome Extraction Isolation and Isolation Purification Kit production reached approximately 165 K Unit.

The market is mainly driven by rapid growth in exosome and extracellular vesicle research. Exosomes are increasingly studied as carriers of RNA, DNA, proteins, lipids, and metabolites, and they are closely associated with intercellular communication, tumor microenvironment, immune regulation, neurodegenerative disease, cardiovascular disease, kidney disease, infectious disease, regenerative medicine, and drug delivery. As more laboratories move from basic EV observation to biomarker discovery, multi-omics analysis, and functional validation, demand for standardized, reproducible, and sample-specific exosome extraction and purification kits continues to increase.

A second driver is the replacement of traditional ultracentrifugation with easier and more

standardized kit-based workflows. Ultracentrifugation remains a reference method in many studies, but it requires expensive equipment, long processing time, skilled operation, and careful protocol control. Commercial kits based on precipitation, spin columns, filtration, size-exclusion, magnetic beads, or affinity capture can reduce equipment dependence, shorten workflow time, improve repeatability, and allow more laboratories to conduct exosome studies. For small-volume clinical samples such as serum, plasma, urine, saliva, and cerebrospinal fluid, kit-based methods are especially attractive because sample conservation and workflow consistency are critical.

The market is also supported by clinical translation and higher requirements for sample purity. Liquid biopsy, early cancer detection, companion diagnostics, RNA biomarker profiling, therapeutic exosome development, and cell-therapy research all require better separation of exosomes from proteins, lipoproteins, cell debris, and non-vesicular nucleic acids. This is pushing suppliers to develop higher-purity kits, magnetic bead methods, PS-affinity capture, marker-specific isolation, RNA/protein co-isolation kits, and sample-type-specific workflows. At the same time, China?s life science reagent market is expanding, and domestic suppliers such as Yeasen, Beyotime, RiboBio, CUSABIO, and MedChemExpress are improving product coverage and cost competitiveness.
