Abstracts

The global Exosome Proteomics Service market size is expected to reach \$ 821 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

To address the challenges of high technical barriers, complex sample processing, and low efficiency in biomarker screening in exosome proteomics research, exosome proteomics services have emerged. Since the rise of exosome research and the innovation of mass spectrometry technology in the early 21st century, this service field has achieved rapid improvement and standardization of its technical system. Currently, exosome proteomics services have developed into a complete solution integrating ultracentrifugation, size exclusion chromatography, mass spectrometry identification, and bioinformatics analysis, covering multi-level analyses such as label-free quantification, TMT/iTRAQ labeled quantification, and targeted validation. It is widely applied in cutting-edge fields such as early disease biomarker discovery, drug mechanism research, tumor microenvironment analysis, stem cell function assessment, and the development of novel drug delivery systems. It can systematically reveal the key protein information carried by exosomes, providing high-value in-depth data support for precision medicine, new drug development, and basic life science research. Exosome proteomics services are accelerating their transformation from research tools to clinical applications, with technological breakthroughs (such as high-purity preparation and high-throughput analysis) and industrial collaboration (such as upstream and downstream linkages) being the core driving forces. In the future, the focus should be on three major areas: the construction of standardized systems, the development of engineered exosomes, and the expansion of clinical application scenarios, to achieve a leapfrog development from 'basic research' to 'clinical application,' ultimately promoting the comprehensive upgrade of precision medicine and personalized treatment.
