Abstracts

The global Explosion Proof Air Sampler market size is expected to reach \$ 83.56 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

An explosion-proof air sampler is an air sampling device that can extract air samples at a controlled flow rate/volume and collect particulate matter, microorganisms, or chemical contaminants in the presence of flammable gases, vapors, or dust in explosive hazardous environments. At the same time, its electrical/mechanical structure meets the requirements of the corresponding explosion-proof regulatory system (such as ATEX/IECEX Ex design or North American Class/Div non-flammable/explosion-proof requirements).

The core market logic of the Explosion Proof Air Sampler is 'to complete compliant sampling in explosion-hazardous areas without sacrificing sampling stability and data integrity.' End-user demand primarily comes from two scenarios: firstly, areas in cleanrooms/controlled environments containing solvents or flammable gases require viable air sampling; secondly, occupational health scenarios such as petrochemical, chemical, and coating industries require individual or point-based sampling of gases/VOCs and particulate matter, with equipment meeting ATEX/explosion-proof ratings or equivalent requirements.

Representative products include Veltek Associates' SMA MicroPortable 'Explosion Proof' (SMA-P300-03), positioned for hazardous environments and explicitly approved as a non-flammable electrical device for Class I/II Division 2 hazardous locations, emphasizing safety designs such as sealed enclosures and exhaust ducts. MBV AG's MAS-100 NT Ex is an explosion-proof version of the portable viable air sampler, targeting room/cleanroom microbial monitoring in areas with 'explosion risks due to solvents or gases,' emphasizing high-precision mass flow sensing and safety. SIBATA offers a more comprehensive product line of standard portable sampling pumps/air

samplers (such as MP-W5P 0.05-5.00 L/min and PMP-001 10-300 mL/min, both emphasizing constant flow and cumulative flow functions), making them more suitable for non-explosive hazardous areas or system-level layouts where the sampling head is inside the area and the pump body is outside the area.
