Abstracts

The global Extended Surface Cooler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Since heat exchanger products have a wide range of application fields, there are different brand patterns in different application fields. For example, Gree has established many benchmark projects in large airports, rail transit, clean energy, commercial buildings and other fields; Haier firmly dominates the magnetic levitation market. It ranks first in the central air-conditioning market and has numerous applications in rail transit and data centers; TICA has established a good reputation in the medical and health fields; McQuay and York have outstanding performance in electronics, medicine and other fields. The wide range of application fields and the diversity of needs determine the characteristics of customized production in the heat exchanger industry.

Extended surface heat exchanger refers to a heat exchanger that greatly increases or expands the heat exchange area by using fins, nails, discs and other accessory surfaces on the outer surface of the heat exchange tube. The heat exchange surface density (area per unit volume) of this heat exchanger is higher than that of a plain tube heat exchanger with the same outer diameter, arrangement and spacing. Increasing the extended surface makes the outer surface area of the heat exchanger in contact with the fluid much larger than the inner surface area, thereby greatly improving the overall heat transfer coefficient of the heat exchanger.
