This report studies External Cardiac Pacemakers market.

Temporary cardiac pacing is an intervention that helps the heartbeat get back to a normal pace if it has been temporarily out of rhythm.

In temporary cardiac pacing, wires are inserted through the chest (during heart surgery), or a large vein in the groin or neck, and are directly connected to the heart. These wires are connected to an external pacing box, which delivers a current to the heart to make it beat normally.

Temporary cardiac pacing can be used for days or weeks. But if there are long-term problems with the rhythm of your heartbeat, then a permanent pacemaker may be needed. This is a small pacing box that gets inserted inside the chest.
