According to our (Global Info Research) latest study, the global External Post-Tensioning Systems market size was valued at US\$ 362 million in 2025 and is forecast to a readjusted size of US\$ 499 million by 2032 with a CAGR of 4.7% during review period.

External post-tensioning systems involve the use of steel tendons placed outside the concrete structure, typically along the surface of beams, slabs, or other elements. These tendons are anchored at the ends of the structure and tensioned using hydraulic jacks after the concrete has set. The applied force compresses the concrete, enhancing its strength and durability. External post-tensioning is often used in bridges, parking structures, and retrofitting existing buildings. It allows for easier adjustments and maintenance compared to internal systems and can be employed to correct deficiencies or improve performance in aging or overburdened concrete structures.

Market demand for external post-tensioning systems is experiencing steady growth, driven by a confluence of factors: a vast global inventory of existing bridges and infrastructure entering an aging phase and urgently requiring efficient retrofitting; continuously increasing traffic loads placing higher demands on structural load-bearing capacity; limited construction space in urban environments fostering the adoption of non-invasive strengthening technologies; a life-cycle cost philosophy prompting owners to select durable solutions that are both inspectable and replaceable; and advancements in smart monitoring and high-performance protective materials, which have significantly enhanced the reliability and service life of external prestressing systems. Meanwhile, in the context of sustainable development, its advantages of avoiding demolition and reconstruction and reducing carbon emissions have further strengthened its strategic

value in green infrastructure upgrades.
