Abstracts

According to our (Global Info Research) latest study, the global Extracellular Matrix Scaffold market size was valued at US$ 43.57 million in 2025 and is forecast to a readjusted size of US$ 71.98 million by 2032 with a CAGR of 7.5% during review period.

An extracellular matrix (ECM) scaffold is a three-dimensional structure composed of proteins, glycoproteins, and polysaccharides that mimic the natural ECM found in tissues. These scaffolds provide a supportive framework for cells to attach, grow, and differentiate, facilitating tissue regeneration and repair. They are often used in tissue engineering and regenerative medicine to create environments conducive to cell proliferation and function, aiming to restore damaged tissues or organs. ECM scaffolds can be derived from natural sources, such as decellularized tissues, or synthesized using biomaterials designed to replicate the properties of natural ECM. These scaffolds promote cellular activities by providing biochemical and mechanical cues that influence cell behavior, thus playing a crucial role in the development of functional tissue constructs?.
