Extruded EMI Shielding Gaskets are electromagnetic interference (EMI) shielding materials produced by extrusion. This type of gasket is usually composed of conductive fillers (such as nickel/graphite or silver/aluminum, etc.) dispersed in an elastomer matrix, and a continuous gasket with a specific cross-sectional shape is obtained by extrusion molding. They provide electrical connections to shield electromagnetic interference and provide environmental sealing at the same time. Extruded EMI shielding gaskets are widely used in situations where EMI shielding and environmental sealing are required due to their continuous conductive path and good environmental sealing performance.
