According to our (Global Info Research) latest study, the global Extrusion Double Corner Brace market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

An extrusion double corner brace is an earthquake-resistant reinforcement device in which a viscoelastic material of polymeric material is sandwiched between steel plates. The joints between columns and beams are called "joints," and they are fan-shaped, divided into four circles. When attached to beam joints or columns, the device absorbs loads on wooden buildings caused by strong winds or earthquakes and suppresses deformation.

Compared to conventional construction methods such as load-bearing walls and bonding hardware, it has superior earthquake resistance effects. Lightweight and compact, it can be installed in space-saving locations such as behind ceilings, and is easy to install. No maintenance is required and can be reinforced in combination with conventional construction methods.
