In the medical field, a face imaging system is used to capture and analyze detailed images of a patient's face for diagnostic, therapeutic, or surgical purposes. These systems often utilize 3D imaging, multispectral cameras, and AI-based analysis to assess facial structure, symmetry, skin conditions, and changes over time. They are commonly used in plastic and reconstructive surgery, dermatology, orthodontics, and maxillofacial surgery.

Medical face imaging systems support pre- and post-treatment comparisons, help with treatment planning, and improve patient communication and documentation. By providing highly accurate visual data, they enhance clinical decision-making and are increasingly integrated into digital health workflows for personalized care.
