Abstracts

According to our (Global Info Research) latest study, the global Factory-floor Software market size was valued at US\$ 3919 million in 2025 and is forecast to a readjusted size of US\$ 8863 million by 2032 with a CAGR of 12.4% during review period.

Factory-floor software (also called shop floor software) refers to a category of industrial software deployed and operated directly on the production workshop site, serving frontline manufacturing equipment, production operators, workshop supervisors, quality inspectors and logistics staff. It connects physical production assets (machine tools, production lines, sensors, AGVs, testing equipment) with digital management systems, covering real-time data collection, on-site execution control, workshop resource scheduling, on-site quality inspection and production tracking.

Unlike office-level ERP or enterprise-level PLM that focus on top-down enterprise planning, factory-floor software targets ****actual on-site production execution****. It collects real-time data from the shop floor, feeds back production status to upper management systems, and pushes scheduling, process and quality instructions down to frontline workers and machines. Its core objectives include reducing production downtime, eliminating paper-based workshop records, tracking work-in-progress (WIP), controlling on-site product quality, optimizing equipment utilization, and realizing transparent digital workshop management.

Typical application carriers include industrial touch screens, workshop industrial tablets, edge computing gateways, production line HMI terminals, and workshop local server clusters. It forms the core digital layer between industrial hardware and enterprise management platforms.
