According to our (Global Info Research) latest study, the global Familial Amyloid Polyneuropathy Therapeutic market size was valued at US\$ 1589 million in 2024 and is forecast to a readjusted size of USD 2341 million by 2031 with a CAGR of 5.8% during review period.

Familial Amyloid Polyneuropathy (FAP) is a progressive, disabling and life-threatening polyneuropathy affecting the peripheral and autonomic nervous system. FAP is an autosomal transmission disorder which is usually due to a point mutation of the transthyretin (TTR) gene. The treatment of familial amyloid polyneuropathies (FAP) is complex and requires a neurological and cardiological multidisciplinary coverage. It includes specific treatments to control the progression of the systemic amyloidogenesis, the symptomatic treatment of the peripheral and autonomic neuropathy (digestive, urinary, sexual, postural hypotension) and the treatment of organs severely involved by amyloidosis (heart, eyes, kidneys).

The global familial amyloid polyneuropathy (FAP) therapeutic market refers to the market for treatments and therapies aimed at managing and treating familial amyloid polyneuropathy, also known as transthyretin amyloidosis (ATTR). FAP is a rare, progressive, and potentially fatal genetic disorder that affects the peripheral nerves and can lead to various symptoms and complications.

Here are some key points related to the global FAP therapeutic market:

Market Overview: The market for FAP therapeutics includes pharmaceutical drugs, gene therapies, and other treatment options aimed at managing the symptoms and

halting the progression of the disease.

Disease-Modifying Therapies: The development of disease-modifying therapies targeting the underlying cause of FAP is a significant focus in this market. These therapies aim to reduce the buildup of abnormal amyloid proteins in the peripheral nerves, which is a hallmark of FAP.

TTR Stabilizers: TTR (transthyretin) stabilizers are pharmacological agents that aim to stabilize the mutated TTR protein and prevent its misfolding and aggregation. Several TTR stabilizers have been approved or are under investigation for their efficacy in treating FAP.

RNA Interference (RNAi) Therapies: RNAi therapies, such as patisiran and inotersen, work by reducing the production of the TTR protein by interfering with the mRNA responsible for its synthesis. These therapies have shown promise in clinical trials and have been approved for the treatment of FAP in some regions.

Liver Transplantation: In some cases, liver transplantation may be considered as a treatment option for FAP. As the liver produces most of the circulating TTR, replacing the diseased liver with a healthy one can halt the production of mutant TTR and slow down the progression of the disease.

Geographic Considerations: The global FAP therapeutic market is influenced by factors such as regional prevalence, healthcare infrastructure, regulatory environments, and reimbursement policies across different countries and regions.

Ongoing Research and Development: The FAP therapeutic market is dynamic, with ongoing research and development efforts focusing on novel therapies and treatment modalities. This includes gene therapies, small molecule inhibitors, and other approaches aimed at providing effective and targeted treatments for FAP.
