Abstracts

According to our (Global Info Research) latest study, the global Far-Field RFID Antennas market size was valued at US\$ 3352 million in 2024 and is forecast to a readjusted size of USD 5893 million by 2031 with a CAGR of 9.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Far-field RFID antennas are a type of antenna that communicates with RFID tags mainly through electromagnetic wave radiation, usually operating in ultra-high frequency (UHF, 860–960 MHz) or microwave bands (such as 2.45 GHz). Unlike near-field antennas, far-field antennas rely on the principle of electromagnetic wave propagation and can achieve a reading distance of several meters or even tens of meters. They are suitable for application scenarios that require large-scale identification, such as warehousing logistics, smart retail, vehicle tracking, personnel positioning, and supply chain management. This type of antenna is usually designed as a directional or omnidirectional structure, with the characteristics of fast reading speed, strong batch reading capability, and flexible deployment. Its performance is greatly affected by the directionality of the tag, material interference, and environmental complexity, so the system integration needs to fully consider the RF environment and tag layout. Far-field RFID antennas are key components for achieving efficient IoT perception and asset visualization management.
