The global Far Infrared Yarns market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Far Infrared (FIR) yarns are special types of yarns that are infused with ceramic particles or minerals that have the ability to emit far infrared radiation. Far infrared radiation is a type of electromagnetic radiation that has longer wavelengths than visible light and is generally considered to be beneficial to the human body. When FIR yarns come into contact with the body, they can absorb heat from the body and emit far infrared radiation back. This radiation is believed to have various health benefits, such as improving blood circulation, boosting metabolism, reducing muscle soreness, and promoting relaxation.
