Abstracts

Farber's disease is a rare inherited condition involving the breakdown and use of fats in the body. In affected individuals, lipids accumulate abnormally in cells and tissues throughout the body, particularly around the joints. The deficiency of an enzyme is called ceramidase resulting in the harmful accumulation of certain chemicals in the body, which causes damage and inflammation. Three classic signs occur in Farber lipogranulomatosis: a hoarse voice or a weak cry, small lumps of fat under the skin and in other tissues (lipogranulomas), and swollen and painful joints. Affected individuals may also have difficulty breathing, an enlarged liver and spleen (hepatosplenomegaly), and developmental delay.
