Abstracts

The global Farmed Tuna market size is expected to reach \$ 2301 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

Farmed Tuna refers to the cultivation of various tuna species, including Bluefin (the most valuable), Yellowfin, and Albacore, within controlled marine sea cages. Due to their biology as high-speed, migratory apex predators, tuna cannot be raised in traditional land-based ponds; instead, they require massive offshore pens with high oxygen levels and strong currents. The industry predominantly utilizes "tuna ranching," where wild-caught juveniles are transferred to cages and fattened on a specialized high-lipid diet. More recently, "full-cycle aquaculture" (closed-loop) has reached commercial viability, particularly in Japan, allowing for production from eggs without depleting wild stocks. The primary commercial advantage of farmed tuna is the ability to control fat content (marbling), ensuring a year-round, consistent supply of premium sashimi-grade meat.

In 2025, global Farmed Tuna production was 80000 MT, and average price was 20,000USD/MT, gross margin 30%.
