Abstracts

The global Feed Grade DL-Methionine market size is expected to reach \$ 2870 million by 2032, rising at a market growth of 3.4% CAGR during the forecast period (2026-2032).

Feed-grade DL-methionine is a synthetically produced essential amino acid additive primarily used in livestock, poultry, and aquatic feeds to supplement methionine deficiency in diets, promoting animal growth, improving feed conversion rates, and enhancing protein deposition, health, and economic benefits of livestock farming.

Upstream suppliers mainly include chemical raw materials such as acrolein, methanethiol, hydrocyanic acid, and sulfides, as well as energy, catalyst, and production equipment suppliers. Downstream suppliers primarily target feed processing companies, large-scale farms, premix feed companies, and the livestock, poultry, and aquaculture end-market.

The global market price for feed-grade DL-methionine is \$2,102 per ton, with annual sales of approximately 1.0482 million tons and a global annual production capacity of approximately 1.2-1.4 million tons. The industry profit margin is 15%.

In the future, the global feed-grade DL-methionine market will continue to develop towards large-scale, green, and high-efficiency production. On the one hand, the growth in global meat and aquatic consumption, the increasing intensification of livestock farming, and the promotion of low-protein diet technologies will continue to drive demand for methionine additives. On the other hand, industry competition will become more concentrated, with leading companies strengthening their market position through cost control, process optimization, and global supply chain layout. At the same time,

stricter environmental regulations, more refined feed formulations, and increased demand for customized nutrition for different livestock species will also drive product upgrades towards higher purity, stable supply, and differentiated solutions.
