Abstracts

The water that is transferred from the condenser or tank into a boiler in order to convert it into steam is known as feed water. In a power plant to preheat the boiler feed, the feed water heater is used. The thermodynamic efficiency is improved by using the preheating technique. The internal energy spent from the stem is captured by the feed water heaters and this energy is used to preheat condensed feed water. The feed water heater reduces the plant operating costs and also avoids the thermal shock to the boiler metal which occurs when the feed water returns back into the steam cycle.
