Abstracts

The global Feedforward Neural Networks market size is expected to reach \$ 21909 million by 2032, rising at a market growth of 13.3% CAGR during the forecast period (2026-2032).

A Feedforward Neural Network (FNN) is a fundamental type of artificial neural network in which information flows strictly in one direction—from the input layer, through one or more hidden layers, to the output layer—without any feedback loops or recurrent connections. Each layer consists of neurons that apply a weighted linear transformation followed by a nonlinear activation function, enabling the network to learn complex input–output mappings. Because the network has no memory of past inputs, FNNs assume that samples are independent and identically distributed, making them well suited for tasks such as classification, regression, and function approximation where temporal or sequential dependencies are not required.

This report studies the global Feedforward Neural Networks demand, key companies, and key regions.
