According to our (Global Info Research) latest study, the global Femtosecond Stimulated Raman Spectrometer (FSRS) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Femtosecond stimulated Raman spectroscopy (FSRS) is an ultrafast nonlinear optical technique that enables the acquisition of ground-state and time-resolved excited-state Raman spectra of a sample, which provide vibrational and thus structural information. The technique works by time-sequencing three pulses in a near-collinear 'pump-probe' geometry. A narrowband picosecond duration Raman pump pulse induces Raman scattering in the sample of interest simultaneously with a coincident broadband femtosecond white light supercontinuum pulse, which effectively amplifies the Raman frequency-shifted light to increase the signal. Finally, an optional electronically resonant pulse, the 'actinic' pulse, initiates photophysical or photochemical processes in the sample of interest at a variable time before the Raman pulse.
