According to our (Global Info Research) latest study, the global Ferroalloys for Steelmaking market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Ferroalloy manufacturers add chemical elements to molten iron, usually during steelmaking. The alloys impart distinctive qualities to steel and cast iron or serve important functions during production. Ferroalloys are used for deoxidation, alloying, and graphitization of steel and cast iron.

ferroalloy, an alloy of iron (less than 50 percent) and one or more other metals, important as a source of various metallic elements in the production of alloy steels. The principal ferroalloys are ferromanganese, ferrochromium, ferromolybdenum, ferrotitanium, ferrovanadium, ferrosilicon, ferroboron, and ferrophosphorus. These are brittle and unsuitable for direct use in fabricating products, but they are useful sources of these elements for the alloy steels. Ferroalloys usually have lower melting ranges than the pure elements and can be incorporated more readily in the molten steel. They are added to liquid steel to achieve a specified chemical composition and provide properties needed to make particular products. They are in fact used in all steels—e.g., plain carbon, stainless, alloy, electrical, tool, and so on.

Ferroalloys are prepared from charges of the nonferrous metal ore, iron or iron ore, coke or coal, and flux by treatment at high temperature in submerged-arc electric furnaces. An aluminothermic reduction process is used for making ferrovanadium, ferrotitanium, and ferroniobium (ferrocolumbium).
