## Abstracts

The global Ferroelectric Tester market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A ferroelectric tester is a device used to measure the electrical properties of ferroelectric materials. Ferroelectric materials are a class of materials that exhibit a spontaneous electrical polarization that can be reversed by applying an external electric field. These materials have unique properties, such as hysteresis and remanent polarization, that make them useful in a variety of applications, including memory devices, sensors and actuators. A ferroelectric tester usually consists of a sample holder, electrodes and a measurement circuit. The sample holder securely holds the ferroelectric material in place, while the electrodes are used to apply the electric field and measure the resulting polarization. The measurement circuitry is responsible for applying the electric field, recording the polarization response, and calculating various electrical properties such as coercive field, remanent polarization, and permittivity. Ferroelectric testers are commonly used in R&D laboratories to characterize the electrical behavior of ferroelectric materials. By understanding the electrical properties, researchers can optimize material composition and device design for specific applications. Additionally, ferroelectric testers are used in the quality control process to ensure the consistency and reliability of ferroelectric materials used in commercial products.

This report studies the global Ferroelectric Tester production, demand, key manufacturers, and key regions.
