According to our (Global Info Research) latest study, the global Fetal Monitoring Devices market size was valued at USD 3070.4 million in 2023 and is forecast to a readjusted size of USD 4302.6 million by 2030 with a CAGR of 4.9% during review period.

Fetal monitoring refers to electronic patient monitoring. It records the vital physiological functions of the fetus and the contractions of the mother's uterus during pregnancy and birth. Fetal monitors are bedside units that include an observing monitoring unit, cables, and electrodes. They measure, record, and display FHR, uterine contractions, and maternal BP and heart rate before and during labor. Fetal monitors detect the FHR and uterine contraction indirectly through the mother's stomach. This can be done either through external fetal monitoring or internal fetal monitoring, which involves the placement of an electrode on the fetal scalp (or other exposed skin surface) to measure the changes in pressure inside the uterus.

External fetal monitoring is carried out by listening to an infant's heartbeat with a special stethoscope attached to two sensors. One sensor uses reflected sound waves (ultrasound) to track the infant's heart rate and the other sensor measures the length of contractions and they are connected to a machine that records the data. According to this industry research report, the external fetal monitoring devices segment will account for the major shares of this market throughout the forecast period.
