## Abstracts

According to our (Global Info Research) latest study, the global Fiber Expansion Agent market size was valued at US\$ 411 million in 2025 and is forecast to a readjusted size of US\$ 523 million by 2032 with a CAGR of 3.5% during review period.

In 2025, the global production of fiber expansion agents was approximately 930,000 tons, with an average selling price of around US\$429 per ton. The capacity of a single production line is approximately 20,000-50,000 tons per year, with an average gross profit margin of about 10-20%. Fiber expansion agent is a composite concrete admixture that combines polypropylene fibers and chemical expansion agents (such as sulfoaluminate). Through the random support of the fibers and the volume expansion of the chemical components, it synergistically compensates for the shrinkage of concrete during hardening, forming a three-dimensional network structure, thereby significantly improving the crack resistance, impermeability, and durability of concrete.

The upstream core raw materials of fiber expansion agents mainly include basic chemical products that provide the expansion source, such as bauxite, gypsum, calcium oxide, and magnesium oxide, as well as mineral powders such as kaolin and fly ash that serve as carriers. Downstream, it is directly applied to the construction and infrastructure industries that have strict requirements for the crack resistance and waterproofing performance of concrete. This mainly includes ultra-long-span structures (commercial complexes, stadiums), underground engineering (subways, pipe corridors, reservoirs), transportation engineering (bridges, pavements), industrial precast components (pipe piles, railway sleepers), and special engineering fields such as nuclear power and hydraulic dams, improving the durability and integrity of structures by compensating for shrinkage.
