According to our (Global Info Research) latest study, the global Fiber-grade High-purity Germanium Tetrachloride (GeCl₄) market size was valued at US\$ 64.84 million in 2025 and is forecast to a readjusted size of US\$ 196 million by 2032 with a CAGR of 6.3% during review period.

Fiber-grade High-purity Germanium Tetrachloride (GeCl₄) is a high-purity germanium chloride used in the manufacture of optical fiber preforms. At room temperature, it is a colorless, volatile, hydrolyzable, and corrosive liquid. It is primarily used as a core dopant in optical fiber preforms. In MCVD, OVD, VAD, and PCVD processes, it serves as a germanium source, which is converted into germanium dioxide through oxidation and hydrolysis and incorporated into the silica glass core, thereby increasing the core refractive index, adjusting the refractive index profile, reducing transmission loss, and improving dispersion performance.

Compared with ordinary fiber-use GeCl₄, fiber-grade high-purity GeCl₄ requires higher overall purity (6N-7N or above 7N) and strict control of metallic impurities, hydroxyl content, moisture, carbon-hydrogen impurities, chloride absorption peaks, particle contamination, and packaging cleanliness. Although its share in optical fiber preform raw material costs is relatively low, it has a decisive impact on preform yield, core refractive index stability, low-loss transmission, dispersion control, transmission capacity, and customer qualification stability. Optical fibers produced with high-purity fiber-grade GeCl₄ can achieve high refractive index, low dispersion, low loss, large transmission capacity, and strong anti-interference capability, making it strategically more valuable than its cost share. It is a key material for high-performance communication fibers, low-water-peak fibers, multimode fibers, specialty fibers, and

fiber network infrastructure.

Global shipments in 2025 are estimated at approximately 268 tonnes, with an average unit price of USD 235.14/kg and a gross margin of 22.55%.

Fiber-grade high-purity Germanium Tetrachloride is a typical small-volume, high-unit-price, and high-qualification-barrier critical material. Although its share in optical fiber preform raw material costs is limited, it has a decisive impact on the performance of germanium-doped communication fiber preforms. Ordinary silica materials can be used to produce optical fibers without GeCl₄, but high-performance communication fibers, low-water-peak single-mode fibers, multimode fibers, and specialty fibers generally require high-purity GeCl₄ doping to increase core refractive index and optimize the refractive index profile.

On the demand side, AI data centers, computing networks, submarine cables, 800G/1.6T optical module interconnects, low-loss long-haul transmission, and multimode short-reach interconnects are driving sustained demand for high-performance fibers. With single-mode fiber consumption of approximately 2 g/km and multimode fiber of approximately 10 g/km, small changes in the proportion of multimode fiber can significantly amplify demand for high-purity GeCl₄. Although single-mode fiber remains the mainstream for communication, growing demand for multimode and specialty fibers in data centers and high-bandwidth short-distance applications increases GeCl₄ consumption per fiber kilometer.

On the supply side, constraints mainly include germanium resources, high-purity distillation capacity, low impurity control, hazardous chemical packaging compliance, and downstream customer qualification. The sharp increase in germanium prices and strengthened export controls in 2026 further elevated the cost base and strategic value of fiber-grade high-purity GeCl₄. Companies with germanium resources, recycling systems, optical fiber waste recovery, high-purity GeCl₄ production, and major customer qualification capabilities are expected to have stronger pricing power in the future market.
