Abstracts

The global Fiber Grating Etching Machine market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Fiber grating etching machine is a device used to manufacture gratings on the surface of the inner cladding of optical fibers. Grating is a periodic refractive index changing structure that can modulate the wavelength, phase, polarization and other properties of light. The principle of fiber grating etching machine is to use ultraviolet laser or chemical etching and other methods to write regular or irregular concave and convex textures on the surface of the inner cladding of the optical fiber, so that the cladding loses the laser transmission conditions, thereby realizing the stripping of cladding light. Purpose. Fiber grating etching machine is an important tool for making fiber gratings and is widely used in fiber lasers, fiber sensors, fiber communications and other fields.

This report studies the global Fiber Grating Etching Machine production, demand, key manufacturers, and key regions.
