A fiber optic focusing lens is an optical component used to focus the light beam output by an optical fiber. It is usually composed of a lens or a convex lens, which can focus the parallel light output from the optical fiber to a smaller point, so as to achieve the focus and concentration of the beam. The main function of the fiber optic focusing lens is to focus the light output from the fiber into a small area, thereby increasing the energy density and power density of the light. This is very important for some applications that require high optical power density, such as laser processing, optical communication, medical equipment and other fields. In addition, fiber optic focusing mirrors can also be used to realize applications such as fiber optic sensors, optical measurement, and optical imaging. The design of a fiber optic focusing lens needs to consider many factors, such as the focal length, aperture, and refractive index of the lens, as well as the diameter and numerical aperture of the optical fiber. In addition, the manufacture of fiber optic focusing mirrors requires high-precision processing and testing techniques to ensure their optical performance and stability.
