Fiber Optic Image Collector is an optoelectronic device that realizes image transmission and acquisition through flexible fiber optic bundles or fiber optic image transmission elements (such as coherent fiber bundles, self-focusing lens arrays). Its core principle is to transmit the target image to the sensor (such as CCD/CMOS) through the light-guiding effect of the fiber optic array. It has the characteristics of anti-electromagnetic interference, corrosion resistance, bendability and long-distance lossless image transmission. It is suitable for special scenarios such as endoscopes, industrial inspections (high temperature/narrow space), military reconnaissance and scientific experiments. According to the structure, it can be divided into rigid image transmission bundles (for high-precision detection) and flexible image transmission bundles (for complex path imaging).
