According to our (Global Info Research) latest study, the global Fiber Optic Inertial Navigation System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The fiber optic inertial navigation system is an inertial navigation system based on fiber optic gyroscopes and fiber optic accelerometers. It uses fiber optic gyroscopes and fiber optic accelerometers to measure the angular velocity and acceleration of objects, and calculates navigation information such as the object's position, speed, and attitude through integration. The optical fiber inertial navigation system has the characteristics of high precision, high stability and strong anti-interference ability, and is suitable for various navigation and positioning applications, such as aerospace, ocean, underground detection and other fields. Because fiber optic sensors have the advantages of no mechanical moving parts, resistance to vibration, and resistance to magnetic field interference, fiber optic inertial navigation systems have broad application prospects in the field of precision navigation and positioning. Fiber optic inertial navigation systems can be used alone or combined with other navigation systems (such as satellite navigation systems) to improve navigation accuracy and reliability. It can still provide accurate and reliable navigation information in environments where satellite signals cannot be received or are blocked.
