The global Fiberglass Automotive Seat market size is expected to reach \$ 209 million by 2032, rising at a market growth of 7.8% CAGR during the forecast period (2026-2032).

Fiberglass automotive seat refers to seat made by replacing traditional metal with fiberglass reinforced composite materials through processes such as molding or injection molding. Their core function is to achieve significant energy conservation and emission reduction through lightweighting, while meeting the stringent requirements of the automotive industry for high strength, high rigidity, and design freedom. It successfully solves the industry pain points of traditional metal seat frames, such as large weight, high mold costs, and low integration, and can improve the passive safety of seats through the excellent energy absorption characteristics of composite materials. The upstream supply chain mainly includes fiberglass precursor suppliers, matrix resin (thermosetting/thermoplastic) and various modifying additive manufacturers; the downstream directly connects with automotive seat system integrators, ultimately providing lightweight solutions for various models of major OEMs worldwide. In 2025, the production volume of fiberglass automotive seats is estimated at approximately 800,000 units, with an average price of approximately US\$150 per unit, a gross profit margin of approximately 30%, and a single-line capacity of 10,000 units per year.
