## Abstracts

According to our (Global Info Research) latest study, the global Ficus Proteinase market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

FIG protease is a kind of hydrophobic protease, which mainly exists in the latex-grade receptor proteins of figs. It is a kind of widely used plant protein, which not only participates in the decomposition and migration of proteins, but also is related to the cell signal transduction. Protease extracted and purified from figs is widely used in food processing, industrial production and medical and health fields because of its good stability and proteolytic ability and good degradation of various proteins. FIG protease (EC 3.4.22.3) is a proteolytic enzyme mainly found in FIG tree gum. Figs belong to the genus figs in the mulberry family. FIG protease is the general name of a series of complex enzymes, all of which are single stranded hydrophobic proteases, so FIG protease is classified as mercaptan protease. FIG protease can be used in food, medicine, cosmetics, industry and other industries.
