## **Abstracts**

According to our (Global Info Research) latest study, the global Field Emission Transmission Electron Microscope market size was valued at USD 553.8 million in 2023 and is forecast to a readjusted size of USD 820.6 million by 2030 with a CAGR of 5.8% during review period.

Transmission electron microscope (TEM) is an imaging technology in which electron beams pass through very thinly sectioned specimens, and field emission refers to the phenomenon that electrons are released from the surface of the cathode under the action of a strong electric field, which belongs to cold cathode emission. As the electrons are transmitted through the specimen and interact with its structure, an image resolves that is magnified and focused onto an imaging medium, such as photographic film or a fluorescent screen, or captured by a special CCD camera. Because the electrons used in transmission electron microscope have a very small wavelength, TEMs can image at much higher resolutions than conventional optical microscopes that depend on light beams. Due to their higher resolving power, TEMs play an important role in the fields of virology, cancer research, the study of materials, and in microelectronics research and development.

Global key manufacturers of Field Emission Transmission Electron Microscope include Thermo Fisher Scientific (FEI), JEOL, Hitachi, etc. Global top three manufacturers hold a share about 95%.
