According to our (Global Info Research) latest study, the global Film Carrier market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Carrier film is a fundamental material used in lithography processes. In the lithography process, photoresist needs to be coated on the carrier film, and then the pattern is transferred to the chip surface through steps such as exposure and development. The carrier film is usually made of highly flat, bubble free, and impurity free materials, such as quartz, glass, etc. Its main function is to provide a flat and clean surface for uniform application of photoresist and precise transfer of patterns. The quality of the carrier film is crucial for the success of the lithography process.
