Abstracts

The global Film Carrier market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Carrier film is a fundamental material used in lithography processes. In the lithography process, photoresist needs to be coated on the carrier film, and then the pattern is transferred to the chip surface through steps such as exposure and development. The carrier film is usually made of highly flat, bubble free, and impurity free materials, such as quartz, glass, etc. Its main function is to provide a flat and clean surface for uniform application of photoresist and precise transfer of patterns. The quality of the carrier film is crucial for the success of the lithography process.

This report studies the global Film Carrier production, demand, key manufacturers, and key regions.
