According to our (Global Info Research) latest study, the global Filter Media for Solid-liquid Separation In Aquaculture market size was valued at US\$ 47.33 million in 2025 and is forecast to a readjusted size of US\$ 89.98 million by 2032 with a CAGR of 9.8% during review period.

Aquaculture solid-liquid separation filter media are key functional materials applied to the front end of recirculating aquaculture systems. They are primarily used to intercept and separate feces, uneaten feed, and suspended solid particles from the water, achieving efficient separation of solid pollutants from the water phase. These filter media typically have a large specific surface area, good water permeability, and anti-clogging properties. They can significantly reduce the load on downstream biochemical filters and nitrification systems, and are a fundamental component in ensuring the stable operation of recirculating aquaculture systems, improving water quality, and increasing stocking density. In 2025, sales volume was 7,500 tons, with an average price of US\$5,500 per ton, a gross profit margin of 47%, and a total production capacity of 8,500 tons.

The market for solid-liquid separation filter media in aquaculture is currently at a critical juncture due to the increasing scale of aquaculture and the rising demands for environmental protection. As the aquaculture industry develops towards high-density, recirculating aquaculture systems and intelligent technologies, the efficient separation of suspended solids and nutrients from aquaculture wastewater has become fundamental to ensuring stable water quality and improving aquaculture efficiency. Traditional methods such as sedimentation tanks and mechanical bar screens are gradually revealing their efficiency bottlenecks in high-intensity recirculating aquaculture systems,

driving a continuous increase in the actual demand for high-performance solid-liquid separation filter media. Especially in large-scale recirculating aquaculture facilities, intensive aquaculture farms, and marine aquaculture systems, filter media capable of rapidly trapping solid particles, forming stable biofilm support, and reducing the load on aquaculture water have become core components of recirculating systems. Market focus has shifted from 'unit cost' to 'separation efficiency, durability, and system compatibility.'

From a technological and industrial competitive landscape perspective, solid-liquid separation filter media are evolving from single-structure materials to composite functional materials and system-level solutions. Traditional sand filters and ordinary cotton filter media have limited efficiency when handling high suspended solids loads. New porous filter media, bio-attachment-enhanced packing materials, and modular composite filter plates offer superior performance, improving solids trapping efficiency while supporting the stable operation of subsequent biological treatment modules. Simultaneously, with the application of intelligent monitoring and automatic cleaning technologies in solid-liquid separation systems, customers are placing greater emphasis on the compatibility and operational efficiency of filter media with the overall aquaculture system when selecting filter media. In the future, the market will place greater emphasis on the multi-functional integration capabilities, long-term operational stability, and synergistic design with water quality control systems of filter media, making filter media an important tool for 'system efficiency improvement' and driving the market to develop from single-product sales to integrated service solutions.
