Filter silencers are devices designed to reduce noise generated by air or gas flow. They work by drawing air or gas from the noise source into the silencer, where internal filters disrupt the flow to absorb and reduce noise. This mechanism is utilized in various settings, including factories, roads, and airports, as part of noise reduction strategies.

Comprising filters and the silencer body, filter silencers incorporate various filters to address different frequency ranges, allowing for broad-spectrum noise reduction. They are maintained by replacing removable filters, and their compact design eases installation.
