## Abstracts

The global Fin Press Line for Heat Exchanger market size is expected to reach \$ 1822 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

Fin Press Line for Heat Exchanger is an automated production line used to manufacture fins for heat exchanger cores, integrating coil unwinding, feeding, punching, forming, cutting, stacking, and line control into a continuous process. Its value lies in improving fin dimensional consistency, stamping efficiency, material utilization, and production stability, while supporting different fin specifications for air-conditioning, refrigeration, and automotive heat exchanger applications. In 2025, production was 35,000 units and the average price was USD 36,000 per unit. The industry's capacity utilization rate in 2025 was about 65%, and the average gross margin was around 25%. Upstream, the key inputs include alloy steel, ball screws, servo motors, linear guides, and controllers, with representative suppliers such as Baowu Steel Group, THK, and Yaskawa Electric providing steel materials, precision transmission components, motion-control parts, and control systems. The midstream segment focuses on press structure design, progressive die matching, automatic unwinding and feeding control, punching and forming process integration, servo motion coordination, cutting and stacking mechanism assembly, line synchronization, precision calibration, safety protection, reliability testing, and final line commissioning, which together determine forming accuracy, production speed, line stability, mold adaptability, automation level, and cost competitiveness. Downstream, Fin Press Line for Heat Exchanger is mainly used in air-conditioning heat exchangers, refrigerator heat exchangers, and automotive heat exchanger production, where it supports fin manufacturing for evaporators, condensers, radiators, and other heat exchange components, with representative customers including Midea Group, Haier Smart Home, and Denso.

Fin Press Line for Heat Exchanger demand will be driven by downstream manufacturers treating fin production as a core lever for heat exchanger efficiency, not merely a sheet-metal process. Air-conditioning and refrigerator heat exchanger producers need stable fin pitch, lower burrs, better material utilization, and continuous output as products become thinner and more energy-efficient. Automotive applications add another layer of complexity, with radiators, condensers, and evaporators requiring tighter dimensional control and faster model changeover. Equipment selection will increasingly depend on die adaptability, feeding accuracy, uptime, scrap reduction, automation linkage, and the ability to support diversified heat exchanger specifications.
