## Abstracts

The global Finasteride (Oral Route) market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Finasteride, when taken orally, is a medication used to treat symptoms of benign prostatic hyperplasia (BPH) in men with an enlarged prostate. It is also prescribed to treat male pattern hair loss (androgenetic alopecia) in men. Finasteride works by inhibiting the action of the enzyme 5-alpha reductase, which converts the male hormone testosterone to dihydrotestosterone (DHT). By reducing DHT levels in the body, finasteride helps to shrink the prostate and promote hair regrowth in men with male pattern baldness. It is important to note that finasteride should only be taken as prescribed by a healthcare provider, as it can have side effects and may not be suitable for everyone.
