According to our (Global Info Research) latest study, the global Fine Guide Star Sensor market size was valued at US\$ 2023 million in 2024 and is forecast to a readjusted size of USD 3261 million by 2031 with a CAGR of 7.1% during review period.

The Fine Guidance Sensor is an interferometer mounted on the Hubble Space Telescope that provides a high precision pointing signal that is fed into the attitude control system during observation.

Fine guide star sensors are used primarily in ground-based and space-based telescopes to compensate for atmospheric turbulence and improve image quality. Fine guide star sensors are a critical component of adaptive optics systems, which adjust the telescope's mirrors in real time to counteract the blurring effects of the Earth's atmosphere. Fine guide star sensors enable high-resolution observations of celestial objects by minimizing the impact of atmospheric distortion, resulting in clearer and more detailed images. In some cases, fine guide star sensors work in conjunction with laser guide stars, where a laser beam creates an artificial guide star in the upper atmosphere for calibration.
