The fine-grained material dehydration system is a complete set of equipment system dedicated to the efficient dehydration of solid materials with small particle size and high moisture content. It is usually composed of core devices such as dehydration screen, cyclone, thickener, filter press, etc. The system effectively removes free water and part of the bound water in the material through the principles of mechanical vibration, centrifugal force, gravity sedimentation, etc., thereby reducing its moisture content and improving the availability and transportation convenience of the material. It is widely used in the dehydration process of fine-grained tailings, coal slime or fine sand in the mining, coal, sand and gravel, environmental protection and other industries.
