According to our (Global Info Research) latest study, the global Fingerpulp Tactile Sensor market size was valued at US\$ 38.1 million in 2024 and is forecast to a readjusted size of USD 157 million by 2031 with a CAGR of 22.6% during review period.

A fingerpulp tactile sensor is a sensing device that mimics the tactile perception of the human fingertip, primarily focusing on detecting pressure, force, texture, and sometimes temperature or vibration when applied to the fingertip area. These sensors are designed to simulate the ability of human finger pulp to perceive small changes in touch or pressure with high sensitivity. The sensor detects stimuli across different types of tactile interactions and transforms the data into digital signals, which are then processed to provide real-time feedback.
