## Abstracts

According to our (Global Info Research) latest study, the global Finished Infusion Sorting Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Finished infusion sorting machine is an automatic equipment for sorting and classifying finished products such as infusion bottles or bags. It usually consists of a conveying system, a visual recognition system, a robotic arm or a manipulator, etc. The working process of the sorting machine for infusion products is usually as follows: 1. The conveying system sends the finished infusion products to be sorted into the sorting area. 2. The visual recognition system scans and detects each finished infusion solution to obtain key information, such as drug name, dosage, production date, etc. 3. According to the preset rules and requirements, the mechanical arm or manipulator sorts the finished infusion solution into the corresponding position or container. 4. After the sorting is completed, the finished product can be further packaged, marked and labeled. The use of sorting machines for infusion products can improve sorting efficiency and accuracy, and reduce errors and confusion that may occur in manual operations. It can help medical institutions realize automatic sorting and management of infusion finished products, and improve work efficiency and quality. At the same time, it can also provide data statistics and traceability functions to facilitate the monitoring and management of drug usage.
