Abstracts

The global Finned Tube Oil Cooler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Finned Tube Oil Cooler is an efficient heat exchange device. Generally, light tubes are combined with a large number of through-hole cooling fins through tube expansion and other processes to form finned tubes, which greatly increases the heat transfer area and improves the heat dissipation. The area can reach 8~10 times of the light pipe. When the finned tube is working, the high-temperature hydraulic oil in the tube transfers heat to the cold air outside the tube through the tube wall and fins. The closely stacked fins outside the tube can greatly optimize the flow of air between the fins and promote the turbulence of the airflow, thereby achieving the purpose of increasing the spring heat coefficient of the air side and enhancing the heat transfer effect. This type of cooler has a simple and compact structure, small volume and mass
