The global Fire Protection Intelligent Operation and Maintenance Monitoring System market size is expected to reach \$ 4917 million by 2032, rising at a market growth of 11.7% CAGR during the forecast period (2026-2032).

The intelligent fire protection operation and maintenance monitoring system is a digital operation and maintenance platform for the full lifecycle management of fire protection facilities. Through Internet of Things (IoT) technology, it collects, remotely monitors, and intelligently analyzes the operational status of equipment such as automatic fire alarm systems, sprinkler systems, fire hydrants, water pumps, smoke control and exhaust systems, and electrical fire monitoring equipment in real time. This system can automatically identify equipment faults, operational anomalies, and potential hazard trends, and link work orders, inspections, and maintenance management to achieve a shift from 'manual inspection and passive repair' to 'online monitoring and predictive operation and maintenance.' It is a core support system for improving the reliability, compliance, and operational efficiency of fire protection facilities in buildings and industrial parks.

The market for intelligent fire protection operation and maintenance monitoring systems is rapidly evolving from 'static compliance checks' to 'dynamic operation and management.' With the advancement of smart city and digital government construction, and the increasing demands for networked building fire protection facilities and digitalized supervision, traditional periodic inspections and manual maintenance are no longer sufficient to meet the need for real-time visibility of equipment status. Intelligent operation and maintenance monitoring systems based on the Internet of Things, cloud platforms, and big data can achieve real-time monitoring of fire protection equipment

operating status, fault early warning, maintenance scheduling, and closed-loop tracking of maintenance, thereby significantly improving facility reliability and hazard response efficiency, and transforming fire management from passive response to proactive prevention.

From the market demand side, multi-stakeholder participation and continuous service models are creating new business opportunities. The demand for real-time monitoring, remote diagnostics, predictive maintenance, and intelligent alarms from government regulatory departments, property management companies, park operators, and general contractors continues to grow. This is not only driving the construction of networked equipment infrastructure but also propelling the rapid development of value-added services such as intelligent operation and maintenance platforms, AI anomaly detection, and mobile collaboration tools. The future market will place greater emphasis on system interconnectivity, data standardization, and cross-platform integration capabilities. Intelligent operation and maintenance monitoring systems are evolving from single-product sales to long-term service subscriptions and full lifecycle operation and maintenance empowerment service models.
